This substantially pure protein was purified from partially purified basic fibroblast growth factor (FGF) by cation exchange HPLC and two reverse-phase HPLC steps. Having purified this protein to apparent homogeneity the amino acid sequence can be determined and pure basic FGF may be synthesised using recombinant DNA techniques (see also AAQ29741). This peptide is biologically active and exhibits either ror random disulphide bonding within the molecule. This protein, an analogue, a biologically active fragment, or a non-toxic salt of it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        also be effective in combating the growth of human melanomas and other melanocytes and the growth promotion of certain related oncogenes such as hst/K53.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
factor (FGF) comprising 0.008-6.1 mg of a mammallan FGF comprising sequence of 140 ((II) and (XII)), 146 ((IV) and (V)), 205 (VI), 266 (VII), 207 ((VIII) and (XI)), 215 (IX), and 208 (X) amino acids (aa), given in the specification, its angiogenically active fragment or mutein. The product of the invention has angiogenic and cardiant activity. (I) is used for treating a human patient for coronary artery disease, and inducing angiogenesis in the human heart. (I) further provides an adjunct for reducing post myocardial infarction injury in humans. The unit dose provides the human patient with a rapid and therapeutic cardiac angiogenesis sufficient to obviate surgical
                                                                                                                                                                                Novel unit dose comprising fibroblast growth factor, its angiogenically active fragment or mutein for inducing cardiac angiogenesis, treating coronary artery disease and reducing post myocardial infarction injury

This sequence represents the bovine FGF-2 protein fragment described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     patients's exercise tolerance time (ETT). It also provides a safe and therapeutically efficacious treatment for the patients with coronary artery disease that lasts at least 6 months before a further treatment is needed. The method provides superior increase of 1.5-2 minutes in

This sequence represents a recombinant bovine fibroblast growth factor-2 (FGF-2) sequence. The invention relates to a unit dose composition (I) for inducing angiogenesis in a human, comprising 0.008-7.2 mg of FGF-2 or an angiogenically active fragment or mutein of FGF-2. The composition (I) and recombinant FGF-2 are useful for treating coronary artery disease or inducing angiogenesis in a human patient. Recombinant FGF-2 may be used to treat unstable angina and acute myocardial

     AAP80613
The published AA sequence of bovine basic FGF was used as a basis for the synthesis of mfd. bFGF gene for expression in E. coli. The nucleotide sequence of this mfd. gene includes codons most often used by E. coli and the inclusion of convenient restriction sites. Oligonucleotides corresp. to both strands of the gene were synthesized in overlapping sections and sesembled into 2 larger sections by hybridation and subsequent ligation. The 2 larger sections were then cloned into an approp. phage vector (M13mp18) for nucleotide sequence analysis. The sections were then cliqued into an expression vector and introduced into E. coli. Bovine and human basic FGF are known to differ by only two AAs. Site directed mutagenesis was used to convert the bovine gene into one coding for the cells of mesodermal origin and may be chemotactic for endothelial cells and fibroblasts. The basic FGF induces neovascularisation and may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Local Similarity Matches 146; Conserv

                                                                                                                                                                                                                                  The present invention describes a novel method for determining the 3-dimensional structure of a macromolecule, particularly a protein. The method involves generating intramolecular crosslinks of known length between the residues of the protein, separating those proteins containing intramolecular bonds, exposing these to a protease so that peptide fragments are produced, identifying these fragments so that their position within the protein is known, and interpreting the data to determine the protein structure. This method can be used in the study of

                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is that of a recombinant human basic fibroblast growth factor which has at least on of the four cysteine residues (pref. Cys 69 and Cys 87) derivatised with an agent able to form a covalent s-C bond with Cys. Typical agents include iodoacetic acid, haloacetamide, alkali tetrathionates, alkyl methanethiosulphonates and 1-6C alkylsulphones. The derivatised bFGF is used to accelerate the healing of wounds (including burns, ulcers, transplants, and bone grafts), to revascularise ischaemic tissue or to regenerate damaged neural tissue. Compared with native bFGF the recombinant derivatised bFGF has better biological activity and stability (esp. not aggragating by dimer formation) and is also easier to isolate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Derived basic fibroblast growth factor - for treating ulcers, regenerating damaged neural tissue, aiding tissue transplant bone graft and revascularising ischaemic tissue

CC factor (FGF) comprising 0.008-6.1 mg of a mammalian FGF comprising 0.008 (X) and 208 (X) amino acids (aa), CC (VII), 207 ((VIII) and (XI)), 215 (IX), and 208 (X) amino acids (aa), CC given in the specification, its angiogenically active fragment or mutein. The product of the invention has angiogenic and cardiant of activity. (I) is used for treating a human patient for coronary artery 0.000 corolarly and inducing angiogenesis in the human heart. (I) further 0.000 corolarly and 0.000 corolarly 0.000 cor

, containing a unique 3' untranslated region.";
chim. Biophys. Acta 1131:314-316(1992).
FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIOGENIC
IN VIVO AND ARE POTENT MITOGENS FOR A VARIETY OF CELL TYPES
VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND
CONCENTRATION OF THESE 2 GROWTH FACTORS.
                                                                                                                                                                                                                                    TGQYKLGSKTGPGQKAILFLPMSAKS

"Characterization of cDNA encoding basic fibroblast growth facto
the marsupial Monodelphis domestica.";
DNA Cell Biol. 13:549-554(1994).
-: FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIOGENIC
IN VIVO AND ARE POTENT MITOGENS FOR A VARIETY OF CELL TYPES
VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND
CONCENTRATION OF THESE 2 GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    01-FEB-1996 (Rel. 33, Created)
